Overview

02

Prerequisite Steps

Overview

What are the prerequisite steps that need to be complete ahead of the Project Online data migration?

↓ Download Software

The following software will need to be downloaded.

The following items require the user to have administrative rights to the PC or Laptop to install software. In an enterprise environment, you will need to speak to your IT department or whomever manages your SOE.

None of the software below has a cost associated with installation:

Prerequisite	Details
Download SharePoint Online Management Shell	The user will need to have SharePoint Online Management Shell installed on their PC. You can download it via this link: https://www.microsoft.com/en-au/download/details.aspx?id=35588
Download PowerShell 7.4 (or higher)	The user will need to have PowerShell 7.4 (or higher) installed on their PC. You can download it via this link: https://learn.microsoft.com/en-us/powershell/scripting/install/install-powershell-on-windows?view=powershell-7.5
Download Altus for Project	For the migration to run, you will need to ensure that you have installed the latest version of Altus for Project. You can download this application via this link: https://project.altus.pro/AltusAddinSetup.msi
Download Azure CLI	You'll need to download this: https://aka.ms/installazurecliwindows

Create Accounts | Project Online

The following account will need to be created for Project Online.

- The account being used to export the data from Project Online must do either of the following:
 - Add yourself as a site collection admin to the PWA Site for which you are running the script.
 - OR if you are in Project permission mode, be assigned **Manage Users and Groups** and the **Access Project Server Reporting Service** permissions on the Project Online instance.
 - If you are in SharePoint permission mode, be a SharePoint admin.
 - When running the PowerShell script, you will need to login with this account.
- The account must have at minimum a Project P3 license.
- This account must be part of the Administrators security group.

Name ▲	Allow
Admin	☐
Manage Users and Groups	☒
General	☐
Access Project Server Reporting Service	☒

Available Groups:

Project Managers
Resource Managers
Team Leads
Confidential Projects Group
Test Group
Portfolio Viewers
Team Members

Groups that contain this user:

Administrators

Create Accounts | Altus

The following account will need to be created for Altus.

- When running the PowerShell scripts, you will need to login with this account.
- The Altus Account will require Microsoft licenses which are detailed in the next section.
- The Altus account will require the following security roles:
 - Altus Admin User
 - System Administrator
 - Basic User

Sustainability BusinessUnit - ingest - full access Role
Synapse Link Service Access
Sync Permissions
☒ System Administrator
System Customizer
Teams Chat Sync App Access
Tour Author
Tour Consumer

Save Cancel

Allocate Licenses

The following licenses will need to be allocated to the Project Online and Altus accounts.

Install Altus for Project

To manage schedules, each user will require Altus for Project.

- Altus for Project is an Add-in for Microsoft Project that exposes additional functionality directly inside Microsoft Project that allows you to manage your tasks in Altus using Microsoft Project.
- <https://docs.altus.pro/index.html>

Install PowerShell

The migration requires PowerShell to be installed on the PC of the user running the scripts.

- The schedule migration process utilises PowerShell scripts to export and import the schedules. The process requires at least version 7.4 which can be obtained free from Microsoft.com.
- The following needs to be installed via this process:
 - Install PowerShell 7.
 - Install Azure PowerShell Commands.
 - Install SharePoint Online Management Shell.
 - Install PowerShell PnP.
 - Install Azure CLI.

Activate Resources

Where applicable, activate any inactive resources in Altus.

- Altus for Project prevent Inactive resources from being added to the schedule via Build Team. As such, we recommend that all resources are set = Active so that the migration runs without issues.
- To set Resources = Active, you will need to follow this process.

Create Solution Layer

To run the migration, the following software will need to be downloaded.

- Altus utilises solution layers to store configuration, code, workflows, and other components.
- These solution layers comprise the OOTB Altus solution. These are referred to as the 'base layers' of the solution.
- Customer-specific enhancements will go into their own layer that sits on top of the base layers.
- As part of the data migration, a new solution layer will be required to capture the following configuration:
 - Project Custom Fields.
 - Bookable Resource Custom Fields.
 - Task Custom Fields.
 - Lookup Tables.
 - List Custom Fields (e.g. Risks and Issues).

Add Configuration

To run the migration, the following software will need to be downloaded.

- Once you have created the solution layer, you need to add all the Project, Resource, and List Custom fields and lookup tables to this solution layer. If there are custom lists, these need to be created as a new table within the context of the solution layer:
- There are six steps to follow here:
 - Create Flat Lookup tables.
 - Create Hierarchical lookup tables.
 - Create Choice Sets.
 - Create Custom Fields.
 - Create a Security Role.
 - Add new fields to Forms.

Grant Consent

To run the migration, the following software will need to be downloaded.

1. Grant Consent

The Altus migration requires permissions to an Enterprise Application which grants permissions within the customers Azure Tenant.

You can either grant consent to the Altus version of this enterprise application **OR**

2. Create your own application

Alternatively, you can create your own application which provides delegated administration rights to all sites by following the steps in this document:

[\[POL\] Altus POL Migration SharePoint app.pdf](#)

To run the migration, the following software will need to be downloaded.

- To avoid issues with migrating the projects and project schedules, we recommend you clear your cache in MS Project.
- Quick Summary:
 - Open MS Project.
 - Select File.
 - Select Options.
 - Select Save > Open Cache location and remove all cache items.

Remove Punctuation

To run the migration, the following software will need to be downloaded.

Issue:	Project online custom fields containing punctuation.
Impact:	The export script will fail if any custom fields have punctuation in their name.
Workaround:	Prior to running the export script, you will need to remove all punctuation from the custom field name.
Resolution:	This is with Microsoft for investigation. Ticket Reference: 2603040030007843

Macro Settings

To run the migration, the following software will need to be downloaded.

- To prevent the scripts from getting stuck during the migration process, it is recommended that you change the macro settings in MS Project.
